

Book Deem Website Report

1. Technologies Used

This project was developed using the following technologies:

- **HTML5:** Used to create the structure of the website pages.
- **CSS3:** Used for styling, layout design, and responsive design.
- **JavaScript:** Used to add interactivity such as filtering books, managing a shopping cart, and validating forms.
- **PHP:** Used for server-side processing of the contact form.
- **MySQL:** Used for storing contact messages in a database.

2. Key Features

The Book Deem website includes:

- **4 main pages:** Home, Books, About, and Contact.
- **Navigation Menu:** Allows users to move between pages easily.
- **Responsive Design:** Works well on mobile and desktop devices using CSS media queries.
- **Modern Layout:** Grid-based layout for displaying books.

3. JavaScript Functionalities

The project includes multiple JavaScript features:

1) Book Filtering System

Users can filter books by selecting a category and searching by title. This makes it easier to find books quickly.

2) Shopping Cart System

Users can add books to a cart. The cart dynamically updates and shows:

- **List of selected books**
- **Total price**

3) Contact Form Validation

The contact form checks:

- **If all fields are filled**

- If the email format is correct
If validation fails, an error message appears.

4. Server-side Features (PHP + MySQL)

This project uses PHP and MySQL to store contact form messages in a database. When a user submits the contact form, the data is validated and saved into the messages table.

An additional admin page (`view_messages.php`) displays all stored messages dynamically.

Conclusion

This website demonstrates the use of front-end technologies (HTML, CSS, and JavaScript) along with back-end technologies (PHP and MySQL) to create a responsive and interactive bookstore website.
